Package: iq (via r-universe)

November 4, 2024

Type Package

Title Protein Quantification in Mass Spectrometry-Based Proteomics

Version 1.9.12

Maintainer Thang Pham <t.pham@amsterdamumc.nl>

Description An implementation of the MaxLFQ algorithm by Cox et al.
(2014) <doi:10.1074/mcp.M113.031591> in a comprehensive
pipeline for processing proteomics data in data-independent
acquisition mode (Pham et al. 2020
<doi:10.1093/bioinformatics/btz961>). It offers additional
options for protein quantification using the N most intense
fragment ions, using all fragment ions, and a wrapper for the
median polish algorithm by Tukey (1977, ISBN:0201076160). In
general, the tool can be used to integrate multiple
proportional observations into a single quantitative value.

create_protein_list   *Creating a list of matrices of fragment ion intensities for all proteins*

Description

For each protein, a numerical matrix is formed where the columns are samples and rows are fragment ions.

Usage

```
create_protein_list(preprocessed_data)
```

Arguments

preprocessed_data

A data frame of four components as output of the `preprocess` function.

Value

A list where each element contains the quantitative data of a protein. The column names are sample names and the row names fragment ions.

Author(s)

Thang V. Pham

References

preprocess

Examples

```
data("spikeins")
head(spikeins)
# This example set of spike-in proteins has been 'median-normalized'.
norm_data <- iq::preprocess(spikeins, median_normalization = FALSE, pdf_out = NULL)
protein_list <- iq::create_protein_list(norm_data)
```

---

create_protein_table   *Protein quantification for a list of proteins*

Description

Travels through the input list and quantifies all proteins one by one.

Usage

```
create_protein_table(protein_list, method = "maxLFQ", ...)
```

Arguments

protein_list	The input protein list
method	Possible values are "maxLFQ", "median_polish", "topN", and "meanInt".
...	Additional parameters for individual quantitation methods.

Value

A list of two components is returned

estimate	A table of protein abundances for all samples in log2 space.
annotation	A vector of annotations, one for each protein.

Examples

```
data("spikeins")
# This example set of spike-in proteins has been 'median-normalized'.
norm_data <- iq::preprocess(spikeins, median_normalization = FALSE, pdf_out = NULL)
protein_list <- iq::create_protein_list(norm_data)
result <- iq::create_protein_table(protein_list)
head(result)
```

---

extract_annotation *Protein annotation extraction*

Description

Extracts annotation columns from a long-format input

Usage

```
extract_annotation(protein_ids, quant_table, primary_id = "PG.ProteinGroups",
                   annotation_columns = NULL)
```

Arguments

protein_ids   A vector of protein ids.

quant_table   A long-format input table. The input is typically the same as input to the preprocess function.

primary_id   The column containing protein ids.

annotation_columns
                A vector of columns for annotation.

Value

A table of proteins and associated annotation extracted from the input.

preprocess

Examples

```
data("spikeins")
extra_names <- iq::extract_annotation(levels(spikeins$PG.ProteinGroups),
                                      spikeins,
                             annotation_columns = c("PG.Genes", "PG.ProteinNames"))
```

---

fast_MaxLFQ | *The MaxLFQ algorithm*

Description

A fast implementation of the MaxLFQ algorithm.

Usage

```
fast_MaxLFQ(norm_data, row_names = NULL, col_names = NULL)
```

Arguments

norm_data   A list of four vectors with equal length `protein_list`, `sample_list`, `id` and `quant` as prepared by the `fast_preprocess` function or the `quant_table` component returned by the `fast_read` function. Note that `quant` should contain log2 intensities.

row_names   A vector of character strings for row names. If NULL, unique values in the `protein_list` component of `norm_data` will be used. Otherwise, it should be the first column of the `protein` component returned by the `fast_read`.

col_names   A vector of character strings for column names. If NULL, unique values in the `sample_list` component of `norm_data` will be used. Otherwise, it should be the `sample` component returned by the `fast_read`.

Value

A list is returned with two components

estimate   A quantification result table in log2 space.

annotation   A vector of strings indicating membership in case of multiple connected components for each row of `estimate`.

fast_read, fast_preprocess

---

fast_preprocess	*Data filtering and normalization*

Description

Filters out low intensities and performs median normalization.

Usage

```
fast_preprocess(quant_table,
                median_normalization = TRUE,
                log2_intensity_cutoff = 0,
                pdf_out = "qc-plots-fast.pdf",
                pdf_width = 12,
                pdf_height = 8,
                show_boxplot = TRUE)
```

Arguments

quant_table   The quant_table component as returned by fast_read.

median_normalization

               A logical value. The default TRUE value is to perform median normalization.

log2_intensity_cutoff

               Entries lower than this value in log2 space are ignored. Plot a histogram of all intensities to set this parameter.

pdf_out   A character string specifying the name of the PDF output. A NULL value will suppress the PDF output.

pdf_width   Width of the pdf output in inches.

pdf_height   Height of the pdf output in inches.

show_boxplot   A logical value. The default TRUE value is to create boxplots of fragment intensities for each sample.

Value

A list is returned with the same components as input data in which low intensities are filtered out and median normalization is performed if requested.

[fast_read](#)

---

fast_read *Reading data from an input file*

Description

A highly efficient reading of a tab-separated text file for iq processing.

Usage

```
fast_read(filename,
          sample_id = "R.Condition",
          primary_id = "PG.ProteinGroups",
        secondary_id = c("EG.ModifiedSequence", "FG.Charge", "F.FrgIon", "F.Charge"),
          intensity_col = "F.PeakArea",
          annotation_col = c("PG.Genes", "PG.ProteinNames"),
          filter_string_equal = c("F.ExcludedFromQuantification" = "False"),
          filter_string_not_equal = NULL,
          filter_double_less = c("PG.Qvalue" = "0.01", "EG.Qvalue" = "0.01"),
          filter_double_greater = NULL,
          intensity_col_sep = NULL,
          intensity_col_id = NULL,
          na_string = "0")
```

Arguments

filename	A long-format tab-separated text file with a primary column of protein identification, secondary columns of fragment ions, a column of sample names, a column for quantitative intensities, and extra columns for annotation.
primary_id	Unique values in this column form the list of proteins to be quantified.

secondary_id	A concatenation of these columns determines the fragment ions used for quantification.
sample_id	Unique values in this column form the list of samples.
intensity_col	The column for intensities.
annotation_col	Annotation columns
filter_string_equal	
	A named vector of strings. Only rows satisfying the condition are kept.
filter_string_not_equal	
	A named vector of strings. Only rows satisfying the condition are kept.
filter_double_less	
	A named vector of strings. Only rows satisfying the condition are kept. Default PG.Qvalue < 0.01 and EG.Qvalue < 0.01.
filter_double_greater	
	A named vector of strings. Only rows satisfying the condition are kept.
intensity_col_sep	
	A separator character when entries in the intensity column contain multiple values.
intensity_col_id	
	The column for identities of multiple quantitative values.
na_string	The value considered as NA.

Details

When entries in the intensity column contain multiple values, this function will replicate entries in other column and the secondary_id will be appended with corresponding entries in intensity_col_id when it is provided. Otherwise, integer values 1, 2, 3, etc... will be used.

Value

A list is returned with following components

protein	A table of proteins in the first column followed by annotation columns.
sample	A vector of samples.
ion	A vector of fragment ions to be used for quantification.
quant_table	A list of four components: protein_list (index pointing to protein)), sample_list (index pointing to sample), id (index pointing to ion), and quant (intensities).

---

maxLFQ	*The MaxLFQ algorithm for protein quantification*

Description

Estimates protein abundances by aiming to maintain the fragment intensity ratios between samples.

Usage

```
maxLFQ(X)
```

Arguments

X   A matrix of ion intensities in log2 space. Columns are samples and rows are fragment ions.

Value

A list of two components is returned

estimate   A vector with length equal to the number of columns of the input containing the protein abundances in log2 space.

annotation   An empty string if all quantified samples are connected. Otherwise, a string of membership of the connected components is returned.

Pham TV, Henneman AA, Jimenez CR. iq: an R package to estimate relative protein abundances from ion quantification in DIA-MS-based proteomics. *Bioinformatics* 2020 Apr 15;36(8):2611-2613.

---

meanInt   *The meanInt algorithm for protein quantification*

Description

Estimates protein abundances by averaging all associated ion intensities

Usage

```
meanInt(X, aggregation_in_log_space = TRUE)
```

Arguments

X   A matrix of ion intensities in log2 space. Columns are samples and rows are
                          fragment ions.

aggregation_in_log_space
                          A logical value. If FALSE, the data aggregation is performed in the original
                          intensity space.

Value

A list of two components is returned

estimate   A vector with length equal to the number of columns of the input containing the
                          protein abundances in log2 space.

annotation   Reserved, currently an empty string.

---

median_polish | *A wrapper for the R implementation of the median polish algorithm*

Description

Estimates protein abundances using the Tukey median polish algorithm.

Usage

```
median_polish(X)
```

Arguments

X   A matrix of ion intensities in log2 space. Columns are samples and rows are fragment ions.

Value

A list of two components is returned

estimate   A vector with length equal to the number of columns of the input containing the protein abundances in log2 space.

annotation   Reserved, currently an empty string

---

plot_protein | *Plotting the underlying quantitative data for a protein*

Description

Displays the underlying data for a protein.

Usage

```
plot_protein(X, main = "", col = NULL, split = 0.6, ...)
```

Arguments

X	Protein data matrix.
main	Title of the plot.
col	Colors of the rows of the data matrix.
split	Fraction of the plotting area for the main figure. The remaining one is for legend. Set this parameter to NULL to ignore the legend area.
...	Additional parameters for plotting.

Value

A NULL value is returned.

Thang V. Pham

References

Pham TV, Henneman AA, Jimenez CR. iq: an R package to estimate relative protein abundances from ion quantification in DIA-MS-based proteomics. *Bioinformatics* 2020 Apr 15;36(8):2611-2613.

Examples

```
data("spikeins")
head(spikeins)
# This example set of spike-in proteins has been 'median-normalized'.
norm_data <- iq::preprocess(spikeins, median_normalization = FALSE, pdf_out = NULL)
protein_list <- iq::create_protein_list(norm_data)
iq::plot_protein(protein_list$P00366, main = "Protein P00366", split = NULL)
```

---

preprocess	*Data preprocessing for protein quantification*

Description

Prepares a long-format input including removing low-intensity ions and performing median normalization.

Usage

```
preprocess(quant_table,
           primary_id = "PG.ProteinGroups",
       secondary_id = c("EG.ModifiedSequence", "FG.Charge", "F.FrgIon", "F.Charge"),
           sample_id = "R.Condition",
           intensity_col = "F.PeakArea",
```

```
median_normalization = TRUE,
log2_intensity_cutoff = 0,
pdf_out = "qc-plots.pdf",
pdf_width = 12,
pdf_height = 8,
intensity_col_sep = NULL,
intensity_col_id = NULL,
na_string = "0")
```

Arguments

`quant_table`	A long-format table with a primary column of protein identification, secondary columns of fragment ions, a column of sample names, and a column for quantitative intensities.
`primary_id`	Unique values in this column form the list of proteins to be quantified.
`secondary_id`	A concatenation of these columns determines the fragment ions used for quantification.
`sample_id`	Unique values in this column form the list of samples.
`intensity_col`	The column for intensities.
`median_normalization`	
	A logical value. The default `TRUE` value is to perform median normalization.
`log2_intensity_cutoff`	
	Entries lower than this value in log2 space are ignored. Plot a histogram of all intensities to set this parameter.
`pdf_out`	A character string specifying the name of the PDF output. A `NULL` value will suppress the PDF output.
`pdf_width`	Width of the pdf output in inches.
`pdf_height`	Height of the pdf output in inches.
`intensity_col_sep`	
	A separator character when entries in the intensity column contain multiple values.
`intensity_col_id`	
	The column for identities of multiple quantitative values.
`na_string`	The value considered as NA.

Details

When entries in the intensity column contain multiple values, this function will replicate entries in other column and the `secondary_id` will be appended with corresponding entries in `intensity_col_id` when it is provided. Otherwise, integer values 1, 2, 3, etc... will be used.

Value

A data frame is returned with following components

`protein_list`	A vector of proteins.

sample_list	A vector of samples.
id	A vector of fragment ions to be used for quantification.
quant	A vector of log2 intensities.

Examples

```
data("spikeins")
head(spikeins)
# This example set of spike-in proteins has been 'median-normalized'.
norm_data <- iq::preprocess(spikeins, median_normalization = FALSE, pdf_out = NULL)
```

---

process_long_format   *Long format to a wide format table using the MaxLFQ algorithm*

Description

A convenient function combining multiple steps to process a long format table using the MaxLFQ algorithm.

Usage

```
process_long_format(input_filename,
                    output_filename,
                    sample_id = "File.Name",
                    primary_id = "Protein.Group",
                    secondary_id = "Precursor.Id",
                    intensity_col = "Fragment.Quant.Corrected",
                    annotation_col = NULL,
                    filter_string_equal = NULL,
                    filter_string_not_equal = NULL,
                filter_double_less = c("Q.Value" = "0.01", "PG.Q.Value" = "0.01"),
                    filter_double_greater = NULL,
                    intensity_col_sep = ";",
                    intensity_col_id = NULL,
                    na_string = "0",
                    normalization = "median",
```

```
                        log2_intensity_cutoff = 0,
                        pdf_out = "qc-plots.pdf",
                        pdf_width = 12,
                        pdf_height = 8,
                        show_boxplot = TRUE,
                        peptide_extractor = NULL)
```

Arguments

`input_filename`	See filename in [`fast_read`].
`output_filename`	
	Output filename.
`sample_id`	See sample_id in [`fast_read`].
`primary_id`	See primary_id in [`fast_read`].
`secondary_id`	See secondary_id in [`fast_read`].
`intensity_col`	See intensity_col in [`fast_read`].
`annotation_col`	See annotation_col in [`fast_read`].
`filter_string_equal`	
	See filter_string_equal in [`fast_read`].
`filter_string_not_equal`	
	See filter_string_not_equal in [`fast_read`].
`filter_double_less`	
	See filter_double_less in [`fast_read`].
`filter_double_greater`	
	See filter_double_greater in [`fast_read`].
`intensity_col_sep`	
	See intensity_col_sep in [`fast_read`].
`intensity_col_id`	
	See intensity_col_id in [`fast_read`].
`na_string`	See intensity_col_id in [`fast_read`].
`normalization`	Normalization type. Possible values are median and none. The default value median is for median normalization in [`fast_preprocess`].
`log2_intensity_cutoff`	
	See log2_intensity_cutoff in [`fast_preprocess`].
`pdf_out`	See pdf_out in [`fast_preprocess`].
`pdf_width`	See pdf_width in [`fast_preprocess`].
`pdf_height`	See pdf_height in [`fast_preprocess`].
`show_boxplot`	See show_boxplot in [`fast_preprocess`].
`peptide_extractor`	
	A function to parse peptides.

Value

After processing with [fast_read](#), [fast_preprocess](#), and [fast_MaxLFQ](#), the result table is written to output_filename. The quantification values are in log2 space. A NULL value is returned. If peptide_extractor is not NULL, fragment statistics for each protein will be calculated based on the result of the extractor function. Counting the number of peptides contributing to a protein is possible using an appropriate extractor function. An example value for peptide_extractor is function(x) gsub("[0-9].*$", "", x), which removes the charge state and fragment descriptors in an ion descriptor to obtain unique peptide sequences. One can examine the ion component returned by the [fast_read](#) function to derive a regular expression to be used in the gsub function above.

process_wide_format   *Merging rows with identical values in a particular column in a table*

Description

Collapses rows with identical values in a particular column in a table. When the values in each row are proportional such as intensities of multiple fragments of a protein, the MaxLFQ algorithm is recommended.

Usage

```
process_wide_format(input_filename,
                    output_filename,
                    id_column,
                    quant_columns,
                    data_in_log_space = FALSE,
                    annotation_columns = NULL,
                    method = "maxLFQ")
```

Arguments

input_filename   Input filename of a tab-separated value text file.

output_filename
                 Output filename.

id_column   The column where unique values will be kept. Rows with identical values in
                 this column are merged. Rows with empty values here are removed.

quant_columns   Columns containing numerical data to be merged.

data_in_log_space
                 A logical value. If FALSE, the numerical data will be log2-transformed.

annotation_columns
                 Columns in the input file apart from id_column and quant_columns that will
                 be kept in the output.

method   Method for merging. Default value is "maxLFQ". Possible values are "maxLFQ",
                 "maxLFQ_R", "median_polish", "top3", "top5", "meanInt", "maxInt", "sum",
                 "least_na" and any function for collapsing a numerical matrix to a row vector.

Details

Method "maxLFQ_R" implements the MaxLFQ algorithm pure R. It is slower than "maxLFQ".

Method "maxInt" selects row with maximum intensity (top 1).

Method "sum" sum all intensities.

Method "least_na" selects row with the least number of missing values.

The value of method can be a function such as function(x) log2(colSums(2^x, na.rm = TRUE))
for summing all intensities in the original space.

Value

The result table is written to output_filename. A NULL value is returned.

spikeins   *An example dataset of 12 spike-in proteins*

Description

A subset of the Bruderer 2015 dataset containing 12 spike-in proteins. The full dataset was exported from the Spectronaut software. The complete dataset has been median-normalized.

Usage

```
data("spikeins")
```

Format

A data frame with 18189 observations on the following 9 variables.

R.Condition Sample names.

PG.ProteinGroups Protein identifiers.

EG.ModifiedSequence Sequence of the fragment ions.

FG.Charge Fragment group charge.

F.FrgIon Fragment ions.

F.Charge Fragment charges.

F.PeakArea Quantitative values.

PG.Genes Gene names.

PG.ProteinNames Protein names.

Examples

```
data("spikeins")
head(spikeins)
```

---

topN   *The topN algorithm for protein quantification*

Description

Estimates protein abundances using the N most intense ions.

Usage

```
topN(X, N = 3, aggregation_in_log_space = TRUE)
```

Arguments

X	A matrix of ion intensities in log2 space. Columns are samples and rows are fragment ions.
N	The number of top ions used for quantification.
aggregation_in_log_space	
	A logical value. If FALSE, data aggregation is performed in the original intensity space.

Value

A list of two components is returned

estimate	A vector with length equal to the number of columns of the input containing the protein abundances in log2 space.
annotation	Reserved, currently an empty string.
